Dimension Actions Workflow Automation with RadarFirst

Enterprise-level efficiency and automation on the Radar® platform

Efficiency and automation are critical for enterprises, and only sometimes for the reasons one may expect.

When resources are limited, finding ways to save time and reduce manual tasks can free up time for more important tasks, like tackling higher-level tasks, scaling processes, and reducing organizational risk.

## Enterprise-Level Efficiency to Reduce Risk

Efficiency can be an enterprise buzzword that equates to resource optimization for leadership and higher work output for teams.

But what if efficiencies could be carved out via workflow automations that allowed privacy, cyber, InfoSec, and compliance teams to effortlessly tackle repetitive, manual, time-intensive (but critical) tasks with a push of a button?

That's when efficiency leads to true enterprise value.

Advanced Dimension Actions, available for users of Radar® Compliance and Radar® Privacy, allows for the configuration of complex workflow automations on the Radar® platform.

Automate essential but time-consuming manual and repetitive tasks to redirect resources to critical decision-making and effortlessly scaling operations, while reducing time to incident resolution for your privacy and cyber teams.

Advanced Dimension Actions make event management easier by automating routine or repetitive tasks. This helps you reduce the time it takes to resolve incidents and lets you allocate more resources to important tasks.

Advanced Dimension Actions is Enterprise-level Automation

Key benefits include:

- **Effortless scalability** of processes and team resources.
- **Simplified communication** across teams, and even up to the Board or outside counsel.
- **Automated task management**, including cross-functional task assignments.
- **Increased operational efficiency** for all impacted teams.
- **Reduced time to resolution** for privacy, compliance, and cyber events.

Advanced Dimension Actions: Features

With Advanced Dimension Actions in Radar® Privacy and Radar® Compliance, you can:

✅ Automate communications.

Notifications can be automatically triggered based on Custom Fields and the status of a Dimension. For instance, C-suite or board members can be automatically notified when the severity of an event is "critical" and the status is "closed."

✅ Automate playbooks.

Automatically run Playbooks based on either a Custom Field or a combination of a Custom Field and the Dimension status.

Enterprises commonly have redundant scenarios that their privacy or cyber team needs to address regularly. Automatically running a Playbook designed for a common enterprise scenario, such as a lost laptop, or sensitive documents left in a public office space, ensures that lower-priority incidents are resolved quickly and consistently while reducing the manual processes required to address common, low-risk events.

✅ Automate incident routing.

Automatically set incident group(s) based on a predetermined custom field value.

When incident volumes are high, the automatic routing of new incidents to the appropriate team or individual within a privacy organization helps to streamline and accelerate incident remediation. **Available exclusively in Radar® Privacy.**

Scale. Simplify. Streamline. Automate.

Your team doesn't need more time to tackle mundane tasks. Your team needs to automate the common, low-risk tasks, that can't be ignored, but don't need to be accomplished using your most valuable resource—your people.

Advanced Dimension Actions is more than just automated efficiency. It helps reduce organizational risk, allows for resources to be spent on strategizing and high-value decision-making, and reduces time to incident resolution for multiple teams across the organization.
